

HTML exercises/learning

Introduction to HTML: Lessons & Exercises

HTML (Hyper Text Markup Language) is the **skeleton** of a webpage. It uses "tags" enclosed in angle brackets (`< >`) to tell the browser what kind of content it is displaying. Most tags have an opening tag (e.g., `<p>`) and a closing tag (e.g., `</p>`) to wrap around your content.

Please look at this slideshow before viewing this material on the Notion page: [HTML + CSS slides](#)

Part 1: Concepts to Learn

1. Core Text Tags

Before formatting text, you need to understand the difference between headings and body text.

- **Headings (`<h1>` to `<h6>`):** These are used for titles and subtitles.

Part 2: Starter HTML Template

Copy the code below, paste it into a text editor (like VS Code, Notepad, or TextEdit), and save the file as `index.html` . You can then double-click the file to open it in any web browser

`<h1>` is the largest and most important (usually reserved for the main page title), while `<h6>` is the smallest.

- **Paragraphs (`<p>`):** Used for regular blocks of text. The browser automatically adds a bit of blank space before and after a paragraph.
- **Emphasis:** To make text **bold**, wrap it in `<strong>...</strong>`. To make text *italic*, wrap it in `<em>...</em>` (which stands for emphasis).

2. How Lists Work

HTML supports two main types of lists: ordered (numbered) and unordered (bulleted).

- **Unordered List (`<ul>`):** Creates a bulleted list.
- **Ordered List (`<ol>`):** Creates a numbered list (\$1, 2, 3...\$).
- **List Items (`<li>`):** No matter which list type you choose, every single item *inside* the list must be wrapped in an `<li>` tag.

HTML

```
<ul>
  <li>First bullet point</li>
  <li>Second bullet point
```

and use it to write your exercise solutions.

<https://codverter.com/src/webeditor?query=eb4a6f14-d730-43e8-9353-d309a302e577>

HTML

```
<!DOCTYPE html>
<html lang="en">
  <head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <title>My First HTML Page</title>
  </head>
  <body>
    <h1>Welcome to My Website</h1>
    <p>This is a basic paragraph where you can describe your page or project.</p>
    <a href="https://google.com" target="_blank">Click here to search</a>
  </body>
</html>
```

```
</li>
</ul>
```

3. Attributes and Hyperlinks

(`<a>`)

Tags can have **attributes**, which are extra pieces of information dropped inside the opening tag to change how it behaves. Attributes always look like

```
name="value" .
```

To make a clickable link, we use the Anchor tag (`<a>`). It requires an `href` attribute to tell the browser where the link should go:

HTML

```
<a href="https://google.com"
target="_blank">Click here to search</a>
```

- `href` : The URL destination website.
- `target="_blank"` : A special attribute that tells the browser, *"Open this link in a brand new tab instead of leaving my page."*
- **"Click here to search"**: The actual text the user sees and clicks on.

4. The Anatomy of an HTML Table

Tables can look intimidating because they require nesting multiple tags inside one another. Think of it layer by layer:

1. `<table>` : The main container that wraps the entire table.

2. **<tr> (Table Row)**: Tables are built horizontally, row by row. Every time you want a new line of data, you create a new **<tr>**.
3. **<th> (Table Header)**: Inside the *first* row, use **<th>** for the column titles. The browser automatically makes this text bold and centered.
4. **<td> (Table Data)**: Inside the *following* rows, use **<td>** for the standard cells.

HTML

```
<table>
  <tr>
    <th>Header 1</th>
    <th>Header 2</th>
  </tr>
  <tr>
    <td>Data A</td>
    <td>Data B</td>
  </tr>
</table>
```

Part 3: Coding Exercises

Before attempting these exercises, please make an account on CodVerter and copy and paste your project link into your pre-curriculum submission. Thank you!

[Login for CodVerter](#)

Difficulty 1: Easy (Adding Text and Emphasis)

Goal: Practice using basic text formatting tags.

- **Task 1:** Inside the `<body>` tags of your template, add a secondary heading (`<h2>`) that says "About Me".
- **Task 2:** Below that heading, add a paragraph describing your favorite hobby. Inside that paragraph, make your hobby **bold** using the `<strong>` tag and make one other word *italicized* using the `<em>` tag.

Feeling confused? Use this prompt: I need to add an `<h2>` heading and a paragraph using `<strong>` and `<em>` tags for an HTML assignment. Don't give me the code. Instead, ask for my attempt and guide me step-by-step to fix any mistakes.

Difficulty 2: Medium (Creating Lists and Links)

Goal: Structure itemized data and connect to external websites.

- **Task 1:** Create a bulleted (unordered) list of your top 3 favorite foods using `<ul>` and `<li>` tags.
- **Task 2:** Below the list, add a hyperlink using the `<a>` tag that points to your favorite website (like `https://www.wikipedia.org`). Make sure the clickable link text reads: "Click here to visit my favorite website!"
- **Task 3:** Add the `target="_blank"` attribute inside your link tag so that it opens in a brand-new browser tab when clicked.

Feeling confused? Use this prompt: I need to create an HTML unordered list and a link that opens in a new tab. Don't write the code for me. Ask me for my best guess first, then coach me through fixing any errors.

Difficulty 3: Hard (Building Data Tables)

Goal: Structure multi-row/multi-column layout data using table elements.

- **Task 1:** Create a schedule or tracking table with **3 rows** and **3 columns**.
- **Task 2:** The first row should use table header tags (`<th>`) to label the columns: *Day*, *Task*, and *Status*.

- **Task 3:** The next two rows should use standard table data tags (`<td>`) to fill in the grid. For example:
 - Row 2: Monday | Push code to GitHub | Completed
 - Row 3: Tuesday | Attend team meeting | In Progress
- **Task 4:** (Bonus) Add a `border="1"` attribute inside your opening `<table>` tag so you can visually see the grid lines in your browser.

Feeling confused? Use this prompt: I need to build an HTML table with headers, rows, and a border attribute. Do not write the code. Ask me to try it first, then give me feedback on my structure until it's correct.
